Sales Data Analysis Using SQL

Name: Tupakula Suchithra

Course: BTech (ECE)

Date: April 2026

1.Objective

To analyze sales data and identify revenue trends

2.Tools Used

- SQL

3. Dataset Description

The dataset contains product sales data including product name, category, price, and order date.

4. Methodology

- Created database and table
- Inserted sales data
- Performed queries using SUM and GROUP BY
- Analyzed product and category performance

5.Results and Analysis

- Laptop generated highest revenue
- Electronics category had highest sales
- Sales increased in February

Result Grid | Filter Ro

Total_Revenue
147500

Result Grid | Filter Row

Product	Total_Sales
Laptop	102000
Phone	41000
Shirt	1500
Shoes	3000

Result Grid | Filter Row

Category	Total_Sales
Electronics	143000
Clothing	1500
Footwear	3000

6.Insights

- SQL helps analyze business data efficiently
- Product performance can be easily identified
- Trends help in decision-making

7. Conclusion

This project helped me understand how SQL is used to analyze structured data and extract meaningful insights.
